Deployment Notes and Updates - Ark

Release Date - March 17, 2026

New Features

Bank Connection Last Updated Status

Bank connections now display a **Last Updated** status showing the most recent date transactions were successfully pulled into the system. This provides users with better visibility into bank feed activity and helps quickly confirm whether a connection is syncing as expected. The new feature can be found on the Admin Portal > Banks Dashboard view.

Improvements

Duplicate Bank Connection Prevention

The system now detects duplicate bank connections and automatically flags and disables them. Users will no longer be able to connect the same bank account multiple times.

Client Name Used as Email "From" Name

Emails sent from the platform using the **"Send from support email"** setting will now display the **Client Name** as the "From" name. Previously, the system used the first portion of the support email address.

This update ensures outbound emails appear more professional and clearly reflect the client's brand when sent to recipients.

Bug Fixes

CSV Export Column Alignment for Journal Entries

An issue where certain **journal entry line descriptions** caused CSV exports to misalign columns has been resolved. Exports will now correctly preserve column structure regardless of line description formatting.
